

# Tolerancing Optical Systems

- Why are tolerances important?
  - Somebody is going to make it (hopefully)
  - It must meet some performance requirement
  - Cost (and schedule) are always important
- Why is it difficult?
  - Involves complex relationships across disciplines
    - System engineering
    - Optical design and analysis
    - Optical fabrication
    - Opto-mechanical design
    - Mechanical fabrication
- If you can tolerance effectively, then you can be a good designer, otherwise you are not.

# Process of optical system tolerancing

1. Define quantitative figures of merit for requirements
2. Estimate component tolerances
3. Define assembly/alignment procedure and estimate tolerances
4. Calculate sensitivities
5. Estimate performance
6. Adjust tolerances, balance cost and schedule with performance
7. Iterate with system engineer, fabricators, management

# System Figure of Merit

- Keep this as simple as possible
- Must propagate all performance specs through assembly
- Typical requirements
  - *RMSWE (root mean square wavefront error)*
  - *MTF at particular spatial frequencies*
  - *Distortion*
  - *Fractional encircled energy*
  - *Beam divergence*
  - *Geometric RMS image size*
  - *Dimensional limits*
  - *Boresight*

# Parameters to tolerance

Allowable errors are called tolerances.

What needs to be toleranced?

- General parts (usually machined metal)
- Physical dimensions of optical elements
- Optical surfaces
- Material imperfections for optics
- Optical assembly

# Estimate system performance

For a merit function that uses RSS to combine independent contributions:

$$\Phi = \sqrt{\Phi_0^2 + (\Delta\Phi_1)^2 + (\Delta\Phi_2)^2 + \dots}$$

$\Phi_0$  is from design residual – simulation of system with no manufacturing errors

$\Delta\Phi_i$  is effect from a single parameter having an error equal to its tolerance

# Calculate sensitivities

- Define merit function  $\Phi$
- Make list of parameters to tolerance,  $x_1, x_2, x_3, \dots$   
all of the things that will go wrong.
- Use simulation to calculate the effect of each of these on the system performance.
  - For each  $x_i$ , use perturbation to find sensitivity

$$\frac{\partial \Phi}{\partial x_i} \cong \frac{\Delta \Phi}{\Delta x_i} = (\text{change in merit function}) / (\text{change in parameter})$$

- So the contribution from a tolerance  $\Delta x_i$  on parameter  $x_i$  is

$$\Delta \Phi_i = \frac{\partial \Phi}{\partial x_i} \Delta x_i = (\text{sensitivity}) * (\text{tolerance})$$

# Sensitivity calculation

- If the nominal merit function  $\Phi_0$  is small (residual aberrations) calculate sensitivity directly

$$\frac{\partial \Phi}{\partial x_i} \cong \frac{\Phi(x_i + \Delta x_i) - \Phi_0}{\Delta x_i} \cong \frac{\Phi(x_i + \Delta x_i)}{\Delta x_i}$$

$\Delta x_i$  is perturbation (by the expected tolerance)

$\Phi(x_i + \Delta x_i)$  is the system merit function of the perturbed system

- To include the nominal merit function  $\Phi_0$

This can be tricky

Evaluate  $\Phi_0$  and  $\Phi(x_i + \Delta x_i)$

- If  $\Phi_0 \ll \Phi(x_i + \Delta x_i)$  then  $\Delta\Phi = \Phi(x_i + \Delta x_i)$  as above
- If  $\Phi_0$  is correlated with  $\Phi(x_i + \Delta x_i)$  then  $\Delta\Phi = \Phi(x_i + \Delta x_i) - \Phi_0$
- Else  $\Phi_0$  and  $\Delta\Phi$  combine in RSS, so

$$\Delta\Phi = \sqrt{(\Phi(x_i + \Delta x_i))^2 - \Phi_0^2}$$

# Using compensators

For most optical systems, a final focus adjustment will be made after the system is assembled. The tolerance analysis must take this into account.

When calculating the effect of each perturbation, you simulate this adjustment:

- simulate sensing the error
- adjust the appropriate parameter

This can be used for other degrees of freedom

***Always make the simulation follow the complete procedure.***

Every compensator requires a real measurement and a real adjustment. The limitations of the measurements and adjustments should show up in your error budget.

# Combining different effects

Calculate system merit function by scaling from the sensitivities, and use RSS

$$\Phi = \sqrt{\Phi_0^2 + \left( \frac{\partial \Phi}{\partial x_1} \cdot \Delta x_1 \right)^2 + \left( \frac{\partial \Phi}{\partial x_2} \cdot \Delta x_2 \right)^2 + \dots}$$

$\Delta x_i$  is now the tolerance for  $x_i$  which could be adjusted

$\frac{\partial \Phi}{\partial x_i}$  is the sensitivity to unit change in parameter  $x_i$

Put the sensitivities into a spreadsheet to allow easy calculation of the system errors with all effects.

# Spreadsheet for combining tolerances

| Parameter              | Tolerance    | Sensitivity                          | Effect on merit function                                |
|------------------------|--------------|--------------------------------------|---|
| $x_1$                  | $\Delta x_1$ | $\frac{\partial \Phi}{\partial x_1}$ | $= \Delta x_1 \cdot \frac{\partial \Phi}{\partial x_1}$ |
| $x_2$                  | $\Delta x_2$ | $\frac{\partial \Phi}{\partial x_2}$ | $= \Delta x_2 \cdot \frac{\partial \Phi}{\partial x_2}$ |
| $x_3$                  | $\Delta x_3$ | $\frac{\partial \Phi}{\partial x_3}$ | $= \Delta x_3 \cdot \frac{\partial \Phi}{\partial x_3}$ |
| .                      | .            | .                                    | .   |
| .                      | .            | .                                    | .   |
| <b>Root Sum Square</b> |              |                                      | <b>= sqrt(sumsq(D1:D23))</b>                            |

You can change the tolerance value

Sensitivities calculated from simulation. These do not change

Automatically recalculate effect from each term and RSS

# Confidence Levels

We assume Gaussian statistics:

This makes it easy

On average, it is correct

Any one system will NOT follow such

Use tolerance analysis to establish confidence levels

|                  |              |                |                |
|------------------|--------------|----------------|----------------|
| Range            | $\pm \sigma$ | $\pm 2 \sigma$ | $\pm 3 \sigma$ |
| Confidence level | 68%          | 95%            | 99.7%          |

Common assumptions for tolerancing:

All error terms are handled so that the tolerated value represents  $\pm 2\sigma$  or 95% confidence

Then the RSS of all of these can be interpreted as  $\pm 2\sigma$  or 95% confidence

This provides 95% yield (5% rejection)

**Monte Carlo analysis can provide similar results**

# LOS Tolerancing example

A) Determine the focal length of the lens and find its nodal point.

Calculate the following sources of error, consider the effects for both inputs

- B) Lateral translation of beamsplitter cube  $20\ \mu\text{m}$
- C) Rotation of the beamsplitter cube about point A of  $3\ \mu\text{rad}$
- D) Lateral translation of the focusing lens of  $0.1\ \mu\text{m}$
- E) Rotation of focusing lens about point B of  $20\ \mu\text{rad}$  (decompose motion into rotation about nodal point + translation of nodal point.)
- F) Lateral translation of the fiber of  $0.1\ \mu\text{m}$
- G) Calculate the combined effect of all of the above. How does this compare to the requirement?

Show how to meet a requirement of  $0.1\ \text{m}$  stability

# Example Spreadsheet

## 1. Sensitivities -- Find these by analysis

|  | From analysis |                              | Sensitivity |                             |
|--|---------------|------------------------------|-------------|-----------------------------|
|  | Perturbation  | Beam #1<br>( $\mu\text{m}$ ) |             |                             |
| B) Lateral translation of beamsplitter cube ( $\mu\text{m}$ )          | 20            | 0                            | 0           | $\mu\text{m}/\mu\text{m}$   |
| C) Rotation of the beamsplitter cube about point A ( $\mu\text{rad}$ ) | 3             | 0.09                         | 0.03        | $\mu\text{rad}/\mu\text{m}$ |
| D) Lateral translation of the focusing lens of ( $\mu\text{m}$ )       | 0.1           | 0.1                          | 1           | $\mu\text{m}/\mu\text{m}$   |
| E) Rotation of focusing lens about point B of ( $\mu\text{rad}$ )      | 20            | 0.1                          | 0.005       | $\mu\text{m}/\mu\text{rad}$ |
| F) Lateral translation of the fiber ( $\mu\text{m}$ )                  | 0.1           | 0.1                          | 1           | $\mu\text{m}/\mu\text{m}$   |

Simply scale the effects

Enter new  
tolerance  
value

Excel multiplies by  
sensitivity to give net  
contribution

## 2. Scale to see effect of changing tolerances

|  | Tolerance | Sensitivity | Beam #1<br>( $\mu\text{m}$ ) |  |
|--|-----------|-------------|------------------------------|--|
| B) Lateral translation of beamsplitter cube ( $\mu\text{m}$ )          | 20        | 0.000       | 0                            |  |
| C) Rotation of the beamsplitter cube about point A ( $\mu\text{rad}$ ) | 3         | 0.030       | 0.09                         |  |
| D) Lateral translation of the focusing lens of ( $\mu\text{m}$ )       | 0.1       | 1.000       | 0.1                          |  |
| E) Rotation of focusing lens about point B of ( $\mu\text{rad}$ )      | 20        | 0.005       | 0.1                          |  |
| F) Lateral translation of the fiber ( $\mu\text{m}$ )                  | 0.1       | 1.000       | 0.1                          |  |

# Assigning initial tolerances

- Start with rational, easy to achieve tolerances
- Only tighten these as your analysis requires
- Rules of thumb for element tolerances
- Rules of thumb for assembly tolerances
- ***Best -- know the limitations of your fabrication and alignment processes***

# Using optical design codes

- Much of the above work can be done entirely within the optical design code.
- You can specify tolerances, and the software will calculate sensitivities and derive an RSS
- **Be careful with this!** It is easy to get this wrong.
- The optical design codes also include a useful Monte Carlo type tolerance analysis. This creates numerous simulations of your system with all of the degrees of freedom perturbed by random amounts.

# Develop complete set of tolerances

- Simulate system performance
  - Include all compensators
- Check overall magnitudes of the terms
  - Terms with small effects, loosen tolerances
  - Terms with big effects, may need to tighten tolerances
- Revise fabrication, alignment plans as needed the goal is:
  - 1. Meet performance specifications**
  - 2. Minimize cost**

# Mechanical tolerancing

- This is a huge, important subject for opto-mechanical engineers.
- Basic types of tolerances for optical systems
  - General position tolerances
    - lens spacing and alignment
  - Surface texture
    - comes from fabrication process
  - Level of constraint
    - overconstrain for stiffness, clearance for motion
    - interference or clearance for optic mounts

# Dimensional tolerances for machined parts

- Depends on fabrication methods and equipment so **discuss these with your fabricator!**
- Rules of thumb for machined parts

| Tolerance Guide for Machined Parts           |                  |                  |
|--|------------------|------------------|
| Machining Level                              | Metric           | English          |
| Coarse dimensions<br>(not important)         | $\pm 1$ mm       | $\pm 0.040''$    |
| Typical machining<br>(low difficulty)        | $\pm 0.25$ mm    | $\pm 0.010''$    |
| Precision Machining<br>(readily available)   | $\pm 0.025$ mm   | $\pm 0.001''$    |
| High Precision<br>(requires special tooling) | $< \pm 0.002$ mm | $< \pm 0.0001''$ |

# Dimensional tolerancing of optical elements

- Diameter
- Clear aperture
- Thickness
- Wedge
- Angles
  - wedge or optical deviation for lenses
  - angles for prisms
- Bevels
- Mounting surfaces

*Start with nominal tolerances from fabricator*

# Tolerancing surface figure

- Radius of curvature
- Surface irregularity
  - Inspection with test plate.  
Typical spec: 0.5 fringe
  - Measurement with phase shift interferometer.  
Typical spec:  $0.05 \lambda$  rms
- For most diffraction limited systems, rms surface gives good figure of merit
- Special systems require PSD spec
- Geometric systems really need a slope spec, but this is uncommon. Typically, you assume the surface irregularities follow low order forms and simulate them using Zernike polynomials

**This topic is covered in detail in OPTI 415/515**

# Define assembly procedure

- Determine adjustments that will be made in assembly that can compensate other errors
  - Each of these needs a measurement to know how to set it
  - Consider several things --
    - Range of adjustment
    - Resolution required (for motion and for measurement)
    - Required accuracy of motion and measurement
    - Frequency of adjustment
- Other dimensions will be set once (like lenses in cells)

# Tolerancing optical assemblies

- Element spacing
- Tilt of elements
- Mounting decenter
- Mounting distortion
- Include stability and thermal errors

*Get nominal tolerances from assembly and alignment procedures*

*Work with the mechanical designer*

# Example – 2 element null corrector

**Table 3.** Accuracy for null lens fabrication

| <u>Quantity</u>             | <u>Tolerance</u>   |
|-----------------------------|--|
| Lens spacing                | 50 $\mu\text{m}$   |
| Lens thickness              | 25 or 50 $\mu\text{m}$   |
| Radius of curvature         | 1 fringe power or 25 $\mu\text{m}$ (whichever is smaller)        |
| Flatness                    | $\lambda/4$  |
| Surface figures             | 0.008 $\lambda$ rms interferometer<br>0.015 $\lambda$ rms lenses |
| Index of refraction         | $\pm 0.0002$ (Grade A BK7)                                       |
| Index Inhomogeneity         | 0.25 E-6 rms (H4 grade)  |
| Wedge in lenses             | 50 $\mu\text{m}$   |
| Decenter in mounting        | 50 $\mu\text{m}$   |
| Tilt in mounting            | 50 $\mu\text{m}$   |
| Primary radius of curvature | 2 mm   |

**Table 4.** Tolerances for null lens

|                       | units | Design<br>value | Tolerance<br>(Allowable<br>Error) | Spherical<br>aberration<br>(nm rms) | Figure<br>(nm rms) |
|-----------------------|-------|-----------------|-----------------------------------|-------------------------------------|--------------------|
| <b>Interferometer</b> |       |                 |                                   |                                     |                    |
